

Appendix B

If you want to **loop a sentence in Python**, you usually mean iterating through its characters or words. Here are the common ways:

1. Loop through each character

```
sentence = "Hello world"
```

```
for char in sentence:
```

```
    print(char)
```

2. Loop through each word

```
sentence = "Hello world"
```

```
for word in sentence.split():
```

```
    print(word)
```

3. Loop with index (position)

```
sentence = "Hello world"
```

```
for i, char in enumerate(sentence):
```

```
    print(i, char)
```

4. Repeat (loop) the whole sentence multiple times

```
sentence = "Hello world"
```

```
for _ in range(3):
```

```
    print(sentence)
```

If you tell me what you specifically want to do (e.g., reverse it, count letters, modify words), I can give a more tailored example.
